

It Started With The Idea...

...the idea that a great deal of energy was being wasted to dry the compressed air used for systems controls when those controls weren't in continuous operation. The idea was so intriguing that it caused four men to pool their knowledge of refrigeration systems, compressed air, and controls to create a solution to reduce the wasted energy. The result of their combined effort was the first cycling refrigerated air dryer. In 1959 those four men, Zellner, Eichenberg, Kunkel and Smith founded a company to produce these unique machines. The first letters of their last names were combined to form the company name – ZEKS – and the doors of a small factory in Pennsylvania were opened.

*An early ZEKS HeatSink™ Dryer
The capacity... 5 scfm!*

A Heritage of Innovation

That was fifty years ago, but the innovative spirit that drove those men to develop the company's flagship product, the HeatSink™ Cycling Refrigerated Air Dryer, still drives the ZEKS of today. Throughout the history of the company technologies to improve compressed air treatment have been developed, tested and refined and incorporated into our complete line of refrigerated and desiccant dryers, mist eliminators and filters, flow controllers and condensate management products.

A Future of Promise

The company has grown to become a leading manufacturer of compressed air treatment equipment, with modern manufacturing facilities near the original small factory. Our goal remains unchanged: to help compressed air users maximize production efficiency while minimizing energy consumption and production waste.

Times have changed, but the high quality and reliability of ZEKS has endured.
